

Project Design Phase
Solution Architecture

Date	30 June 2026
Team ID	
Project Name	House Rent
Maximum Marks	4 Marks

Solution Architecture:

The House Rent system follows a MERN Stack architecture that connects the frontend, backend, database, and users through a secure and scalable web application. The system consists of three user roles: Admin, Owner, and Renter. Renters can browse properties, submit booking requests, and view booking status. Owners can add and manage properties, approve or reject booking requests, and monitor their listings. Administrators manage users, properties, and bookings to ensure the platform operates efficiently. The backend handles business logic, authentication, and API requests, while MongoDB securely stores user, property, booking, and transaction data.

- Design a secure and scalable rental management platform.
- Connect frontend, backend, and database efficiently.
- Support separate modules for Admin, Owner, and Renter.
- Ensure secure authentication and authorization.
- Enable seamless property management and booking workflows.
